Static vs dynamic

Readiness analysis

Structured data analysis

Static vs dynamic ⓘ

Your content is mostly static.
 Amazing, most of your content is not dynamic and readable by LLM Crawlers.

Readiness analysis ⓘ

An overview of how well your content is prepared for AI Search.

Category	Score
▲ Acronyms and Terminology Technical terms and acronyms (SEO, CMS, hreflang, canonical, schema.org, Lighthouse) are used frequently. Some are self-explanatory for the target audience, but a few are not explained on first use (e.g., 'GEO' is never defined; 'baseline' and 'part de voix' lack definition). Recommend a short 'Terminology' tooltip or glossary for visitors unfamiliar with these terms and ensure first-use expansions (e.g., 'GEO (géolocalisation / référencement local)').	70%
▲ Paragraph Cohesion Most paragraphs focus on a single idea (e.g., each step of the 4-step process). A few blocks mix topics: the code-centric 'Architecture & source' alternates between code lines and narrative, and the 'Vos accès' list mixes security claims with feature behavior (stop/rollback). Split code examples into a monospace/code box and move process descriptions into a short paragraph or bullets for clearer flow.	72%

▲ Modular Content Enhancements

 70%

The content is already modular (audit, technique, contenu, mesure) and would benefit from explicit, reusable blocks: a) 'Quick Audit Checklist' (place under Audit); b) 'One-page How-to for structured data' (insert under Technique); c) 'Sample before/after copy' and 'UI proposal workflow' (move the 'Proposition/services' UI snippet into a dedicated Example module); d) 'CMS support comparison table' (where you list WordPress/Shopify/Webflow). These modules make the page easier to reuse in emails, landing pages, or knowledge base.

▲ Semantic Repetition

 70%

Key ideas (machine-readable content, structured data, one-question-per-page) are repeated across sections — generally helpful for emphasis. Some redundancy occurs (the same three conditions and the 'être cité' explanation appear multiple times with similar wording). Introduce synonyms to vary phrasing ('données structurées' / 'balises schema.org'; 'lisible par les machines' / 'contenu rendu dans le HTML initial') and consolidate duplicate passages to tighten the narrative.

▲ Section Integrity

 75%

The page is divided into clear sections (intro, 'Comment se faire citer par les IA?', three technical conditions, 'Comment on s'y prend' with 4 steps, 'Vos accès', CMS support, workflow, 'Architecture & source', metrics, FAQ, contact). Headings are largely present and meaningful, but a few sections mix multiple ideas: 'Illustration, pas un résultat' sits between explanation and the three conditions and reads like a subheading without clear separation; the 'Proposition/services · meta_description' and journal snippet interrupt the workflow description and feel like embedded UI samples rather than a standalone section. Consider splitting UI examples and code snippets into distinct "Examples / Live UI" blocks and ensuring every heading directly precedes its focused content.

▲ Summary Block

 60%

There is no dedicated 'Key takeaways' or 'Quick recap' block. The intro and H1 summarize the offer but do not present a compact bulleted takeaway. Add a short 'En bref' box under the main hero with 3 bullets: what you do, how long it takes to see results, and one-line proof (e.g., 'Présence mesurée sur 25 questions en FR/NL'). This helps skimming visitors and improves SERP snippets.

▲ Illustration Opportunities

 85%

Several concrete visuals would improve comprehension: 1) 'Before / After assistant answer' mockup placed next to 'Comment se faire citer par les IA?' showing search assistant output without and with your site as a source. 2) Process flowchart for 'Comment on s'y prend' (Audit → Technique → Contenu → Mesure) with responsibilities (Système vs Nous). 3) Screenshot or mock of the proposal UI (the 'Proposition/services' example) moved into an 'Examples' panel. 4) Technical diagram in 'Architecture & source' showing where schema.org, hreflang, canonical and HTML-initial content sit in the page response. 5) Metrics dashboard mockup under 'Les chiffres de cette page' showing the baseline / aujourd'hui comparison.

▲ Tone and Language Check

 85%

Overall tone is professional, transparent and appropriately confident for B2B services. Phrases that could be softened for neutrality include accusatory marketing lines (e.g., 'Une agence qui vous le promet vous dit déjà quelque chose sur le reste') — consider 'Toute agence qui promet la première position doit être regardée avec prudence.' Maintain consistent formality and avoid mixing casual UI labels into narrative (move 'AccepterRefuser' and journal snippets into example UI).

▲ Readability	80%
The content already supports a Q&A style: it includes a dedicated 'Questions fréquentes' section and several explicit Q&A-style headings (e.g., 'Au bout de combien de temps...', 'Garantissez-vous la première position...'). Elsewhere, the explanatory sections (How to be cited, Three conditions) could be rephrased as explicit questions and succinct answers to improve skimmability (for example: 'Comment les IA choisissent-elles une source?' followed by the three-step answer). Turning step intros ('01 Audit', '02 Technique') into quick FAQ-style micro-Q&As would help readers and search engines.	
▲ Specificity	68%
The page gives several concrete datapoints (Lighthouse categories and example baseline metrics; '25 questions', 'FR et NL', 'audit gratuit en 48 h' appears in a proposed meta). However, some claims remain vague: timelines like 'quelques semaines' / 'plusieurs mois' could be refined with ranges and conditions, and pricing, sample deliverables, or case-study results are not shown. Add quantified SLAs (e.g., 'audit initial sous 48h, rapport de 15–20 pages'), and include a short example case (before/after metrics) to increase credibility.	
▲ Jargon and Metaphors	65%
The text uses domain terms and some marketing phrasing: 'GEO et SEO', 'part de voix', 'baseline', 'pilote', 'mode automatique', 'données structurées', 'schema.org'. These are acceptable for a professional audience but could be softened for broader readers (e.g., replace 'baseline' with 'point de départ', 'part de voix' with 'share of mentions', 'pilote' with 'processus automatique'). Avoid mixing English words without definition ('GEO') or give a parenthetical explanation.	
▲ Clarity and Assertiveness	75%
The tone is transparent and mostly assertive—explicitly refuses guarantees, which builds credibility. A few lines are hedged or vague ('Ce que nous ne promettons pas', 'Le système ne modifie pas votre site en direct') and would be stronger if you state the outcome-focused promise up front (e.g., 'Nous livrons : audits bihebdomadaires, propositions appliquées sur demande, journal d'écritures'). Replace passive phrases with direct commitments where possible.	
▲ External Link Suggestions	80%
Add 2–3 authoritative external references to support technical claims. Suggested anchors and targets: a) 'schema.org structured data reference' → https://schema.org (anchor: 'schema.org — données structurées'); b) 'Google Structured Data guide' → https://developers.google.com/search/docs/appearance/structured-data (anchor: 'Guide Google : données structurées'); c) 'Lighthouse performance audits' → https://developers.google.com/web/tools/lighthouse (anchor: 'Google Lighthouse — performance & accessibilité'). These links add credibility for technical readers and help SEO trust signals.
